

# Data Flow on QuickTrack

Data transmission from STG devices is designed so it never needs to touch your organization's network.

## How Data is Sent:

## Technical Details

AES 256 encryption for cellular data transmission is ultra-secure. The US Nuclear Launch Codes are encrypted with the same method.

Devices are only able to transmit small amounts of data. No computing happens on the device. Only raw signal strength and device health data is able to be sent.
